

Jingzhang Human City OS

From an AI showcase to a city for people | Four value chains, one reversible city release

A

Human dignity

Retention, transition, inclusion, wellbeing

B

Machine-ready

City APIs, silicon ROW, reversible space

C

Hard constraints

Energy, climate, sandbox, data, releases

D

Spillovers

Tech, standards, knowledge, OPC, global services

Provisional boundary for generation and design discussion only; recompute after official geometry release.

Six-layer Spatial Operating System

Statutory land use remains pending; this diagram shows conceptual functions, reversible space, and human support

Provisional boundary for generation and design discussion only; recompute after official geometry release.

Three areas, three distinct answers

Rectangular key areas are provisional repository constraints; mechanisms and scenarios do not upgrade them to official redlines

01 Zhongzhiyuan

Embodied-AI testing + compute-energy audit + standards spillover

02 AI Origin Community

Reskilling + city API + intergenerational learning

03 Dazhongsi

Public-data authorization + global services + OPC commons

Provisional boundary for generation and design discussion only; recompute after official geometry release.

A city release, not an AI rendering

- A: community retention, work transition, age-friendly inclusion, and AI-worker wellbeing.
- B: city API, silicon right-of-way, low-altitude concepts, embodied testing, and reversible space.
- C: PUE, green power, climate, data authorization, sandbox, and release notes are hard gates.
- D: technology, standards, and knowledge spill over through OPCs, small teams, regional and global services.
- All three key areas use provisional extents and require full recalculation after official data arrives.

Dual human-machine mobility + blue-green resilience

All routes are functional concepts, not road redlines, flight paths, or engineering alignments

Rules before movement

- Human-first routes
- Silicon right-of-way
- Resilience inspection
- Screen-free / sponge green
- Named accountable operator
- Insurance and incident response
- Data minimisation
- Human takeover
- Reversible pilot

Provisional boundary for generation and design discussion only; recompute after official geometry release.

Metrics are evidence: known, unknown, reversible

Every known value is recomputed from EPSG:4548 geometry; social outcomes and energy performance stay unknown without measurements

4

Human-first nodes

4

Machine-city nodes

6

Test scenarios

3

City releases

18.3%

Retention support area

15.1%

Reversible space

Must remain unknown

Resident retention rate

No household baseline

Operational PUE

No compute design or metering

Recovered heat

No heat demand or network

Provisional boundary for generation and design discussion only; recompute after official geometry release.

Human floor

- Six personas include existing/older residents and workers at substitution risk.
- Human service, privacy, paid transition, and screen-free recovery are non-negotiable.

Machine boundary

- Machine right-of-way is a controlled permit, not a natural right.
- Least privilege, logs, takeover, insurance, and removal must coexist.

Compute and climate

- Beijing context: new intelligent-compute PUE generally ≤ 1.25 ; large advanced facilities generally ≤ 1.15 .
- 30% is only a design baseline; actual PUE, green power, and heat remain unknown.

Version governance

- v0.1 baseline; v0.2 reversible tests; v1.0 reviewed expansion.
- Sixteen scenes, six tests; public issues, incidents, and withdrawals enter the release note.
